FOREWORD

The Bulletin No. 130 series is published annually in five volumes. Each volume presents hydrologic data for one of five reporting areas of the State. These areas and the organization of this bulletin are outlined on pages ii and iii.

The basic data programs of the Department of Water Resources have been coordinated with the activities of other interested agencies to satisfy specific needs of agencies within the State. The specific objectives and authorizations for the basic data programs are enumerated in Table 1 of the text.

Bulletin No. 130-65 presents useful, comprehensive, accurate, and timely hydrologic data which are prerequisites for effective planning, design, construction, and operation of water facilities.

William R. Gianelli, Director

ENGINEERING CERTIFICATION

This report has been prepared under my direction as the professional engineer in direct responsible charge of the work, in accordance with the provisions of the Civil and Professional Engineers' Act of the State of California.

Registered Civil Engineer

Registration No. C10561

Date March 10, 1967

ATTEST:

C. A. McCullough
District Engineer
San Francisco Bay District

Registration No. C8123

Date 3/13/67

ABSTRACT

Tables show data on climate, surface water flow, ground water levels, and surface and ground water quality during the 1964-65 water year. Figures show fluctuation of water levels in wells and specific conductance in Alameda Creek near Niles and in Bethany Forebay at the South Bay Pumping Plant. Plates show locations of climatological stations, surface water measurement stations, surface water quality stations, and ground water basins or units, and the status of sea-water intrusion in the Santa Clara Valley East Bay area and in the Salinas Valley.

CHAPTER I. INTRODUCTION

The Department of Water Resources is concerned with development and use of water supplies and with methods that are employed to observe and measure hydrologic conditions. Hydrologic data are used for the planned development of new water supplies, hydropower, drainage, flood control, navigation, and other associated engineering projects.

This report contains a record of hydrologic data collected and assembled by the San Francisco Bay District of the Department of Water Resources. It brings together in a permanent and usable form data on Surface Water Quality and Measurements from October 1, 1964, to September 30, 1965, and data on Climate, Ground Water Measurements, and Ground Water Quality from July 1, 1964, to September 30, 1965.

Other reports of basic water resources data include:

Surface Water Records of California, Vol. 1
(U. S. Geological Survey)

Climatological Data (U. S. Weather Bureau)

Hourly Precipitation (U. S. Weather Bureau)

Users of hydrologic data should be aware of the limitations inherent in the data. Most standard texts on hydrology contain a description of the instrumentation and methods used in collecting the data together with methods of using and interpreting the data. The report of the Hydrology Subcommittee of the Pacific Southwest Inter-Agency Committee entitled "Limitations in Hydrologic Data as Applied to Studies of Water Control and Water Management", dated February 1966, gives a detailed presentation of the subject and includes references to other publications.

CHAPTER II. SUMMARY OF DATA ACTIVITIES

A summary of the basic data activities in the Central Coastal Area is presented on Table 1. The summary indicates for each activity the origin, purpose, authorization, type of data collected, frequency of measurements or service, agency collecting the data, and number of stations of each type.

Climate

The objective of the climate activity is to assure sufficient historical records of climatological data to plan water development projects to meet the social, economic, and physical needs of the people of California. This objective is achieved by providing cooperative assistance to the U. S. Weather Bureau in the maintenance of its climatological station network. Information collected includes data on precipitation, temperature, evaporation, and wind. These data are supplemented with data gathered by the Department where necessary for the Department's needs.

The optimum operation of reservoirs requires data of precipitation, evaporation, and wind movement. Reservoir spillway design requires data on duration, frequency, and intensity of rainfall over the entire drainage area. Precipitation data from a few stations are needed for early forecasting of possible flooding and water supply conditions.

Climatological data summaries are published in Appendix A.

Surface Water Flow

The objective of the surface water flow activity is to provide a historical record of the flows and stages of surface water throughout the State. This activity augments that of the U. S. Geological Survey and other agencies to provide a statewide base network of primary and secondary stream gaging stations that will satisfy the full needs of the Department and State

TABLE I

SUMMARY OF DATA ACTIVITIES IN THE CENTRAL COASTAL AREA

Activity	Origin	Purpose	Authorization	Data			
				Type Collected	Collected By	Frequency Measured or Serviced	Number of Stations
Climate	1956	To supplement records compiled by the Weather Bureau and to index and file all available data for ready use.	Secs. 228, of Water Code	Precipitation	Cooperators USWB USWB	Daily Daily Hourly	77 95 58
				Temperature	Cooperators USWB	Daily Daily	51 62
				Evaporation and Wind	Cooperators USWB	Daily Daily	12 6
Surface Water Flow	1924	To provide an inventory of data on surface water which will be available now and in the future for: (1) forecasting stream-flow; (2) planning water development projects; (3) operation of flood control and multiple purpose projects; (4) studying tidal action; and (5) formulation of agreement on water rights without expensive litigation.	Secs. 225, 226 of Water Code	1. Streamflow	DWR USGS (Fed.-State) USGS (Other)	1. Measured monthly	1 60 60
				2. Tidal Stage	DWR	2. Visited monthly	2
				3. Stage	DWR	3. Visited semi-annually	1
Ground Water Measurement	1917	To compile representative ground water data so that: (1) information will be available for future conjunctive operation; (2) appraisal can be made of drainage and overdraft problems; (3) local interest and cooperation will be stimulated; and (4) planning to develop the potential ground water basins can be facilitated.	Secs. 225, 226, 228, of Water Code	Depth to Ground Water	DWR, USGS and Cooperators	Key wells measured once a month	391 monthly wells, of which DWR measured 33
						Grid wells measured annually or semi-annually	1589 grid wells, of which DWR measured 48
Surface Water Quality Data	1951	Objectives of this program are: (1) to determine the quality of the State's surface waters, (2) to detect changes in quality and alert control agencies when adverse changes occur; (3) to determine trends; (4) to record and catalogue the data in a readily available form; and (5) to disseminate the data and information gathered.	Sec. 229 of Water Code	Mintral (complete mineral semiannually, partial mineral remaining months)	DWR	Monthly	24
				Spectrographic (trace elements)	DWR	Semiannually	7
				Radiological	DWR	Annually	23
				Bacteriological	DWR	Monthly	22
				Specific conductance (continuous recorder)	DWR	Twice each month	1
Ground Water Quality	1953	To compile representative ground water quality data to: (1) establish the quality of existing ground water bodies in the State; (2) provide for organization and ready dissemination of ground water quality data.	Sec. 229 of Water Code	Standard and partial mineral	DWR and Cooperators	Annually	371
						Semiannually	159
				Heavy metal	DWR	Quarterly	2
				Radiological	DWR	Quarterly	2

in connection with water-associated engineering activities. Knowledge of the occurrence of surface water, quantitatively with time and location, is basic to development of the water resources of the State. Continuous historic records of natural streamflow are essential to select and operate water development projects, to determine the maximum amount of water that can be anticipated on a firm basis at a storage site, and to determine the size of a reservoir required to obtain certain firm yields at that site. Long-time records of streamflow are also essential to formulate and operate flood control projects. These records can provide the basis for development of agreements on water rights without expensive litigation.

The surface water activities in the Central Coastal Area involve the operation and maintenance of stream gaging and tidal stage stations, and the collection and compilation of surface water imports and stage records.

Surface water flow data gathered by the Department and similar data collected from other agencies are included in Appendix B of this report.

Ground Water Measurement

The objectives of the ground water measurement activity are to provide sufficient records of ground water level data for the planning and development of the ground water resources of the State; to determine the amount of water in storage and the change in storage over time; and to determine the direction and magnitude of the movement of ground water. All studies of ground water problems and plans for solution of these problems must be founded upon records of water level measurements and upon quality analyses of water samples obtained over a period of years.

Table 2 gives an areal summary of the ground water data collected in the Central Coastal Area. Ground water level data from selected wells are included in Appendix C.

Surface Water Quality

The surface water quality data activity provides basic information about chemical, physical, and sanitary quality characteristics of the State's surface waters. The information is used to assess the usability of these waters; to determine water treatment needs; to assess fish, wildlife, and recreational potentials; to identify conditions requiring remedial action or intensive investigation; and to support hydrologic studies.

Most of the data have been collected by scheduled sampling of an established network of stations covering major streams. Additional data are obtained as a result of special studies. Surface water quality data developed by this Department in the Central Coastal Area, except data from investigational stations in the San Francisco Bay System below Antioch, are presented in Appendix D.

Ground Water Quality

The ground water quality data activity provides basic information about quality characteristics of the State's ground waters. The information is used to assess the usability of ground waters, to determine treatment needs, to support hydrologic studies, and to identify conditions requiring remedial action or intensive investigation.

Most of the data have been collected by scheduled sampling of an established network of wells in the larger ground water basins. Additional data are obtained as a result of special studies.

Table 2 gives an areal summary of ground water data collected in the Central Coastal Area. Records of ground water quality are presented in Appendix E.

Appendix A

CLIMATE

INTRODUCTION

This appendix contains station index, monthly precipitation, monthly temperatures, and monthly evaporation tables. The tables cover the period from July 1, 1964, to September 30, 1965.

Methods and Procedures

Standard meteorological equipment is used at most of the stations. The stations are operated according to practices established by the U. S. Weather Bureau. Commonly accepted procedures are employed in summing up monthly totals and computing mean values.

Coding

The numbering system used by the Department was developed to facilitate station identification for data processing machines. Station numbers are composed of three components - the drainage basin designation, the alpha order number, and the subnumber.

Drainage Basin Designation

The State was divided into major hydrographic areas and each of these areas was assigned an alphabetical letter which is the first digit of the drainage basin designation. The second digit was obtained by dividing the major hydrographic areas into stream basins of primary importance and assigning a number of 0-9 with 0 generally being the valley floor.

The major hydrographic areas and the subareas which are reported in this volume are as follows:

Hydrographic Area D
Central Coastal Area

D0 - Santa Cruz Coast
D1 - Pajaro-San Benito Rivers
D2 - Lower Salinas River
D3 - Upper Salinas River
D4 - Monterey Coast

Hydrographic Area E
San Francisco Bay Area

E0 - San Francisco Bay
E1 - Coast-Marin
E2 - Marin-Sonoma
E3 - Napa-Solano
E4 - East Bay
E5 - Alameda Creek
E6 - Santa Clara Valley
E7 - Bayside-San Mateo
E8 - Coast-San Mateo

Hydrographic Area F
North Coastal Area

F8 - Mendocino Coast
F9 - Russian River

Alpha Order Number and Subnumber

The four digit alpha order numbers are assigned each station to denote its order in alphabetical sequence, mainly for machine processing. As the collection of data progressed, it was found necessary to add a subnumber of two digits to the four-digit alpha number to maintain the alphabetical order of all station names.

EXPLANATION OF TABLES

Symbols and abbreviations used in this appendix are:

B Adjusted to a full month.

E Wholly or partially estimated.

M All or part of record missing. When used with a value, less than ten days of records are missing.

- Record missing.

RB Record begins.

RE Record ends.

T Trace, an amount too small to measure.

V Includes total for previous month.

* Amount included in following measurement, time distribution unknown.

Climatological Station Index

Table A-1 is an index of climatological stations. Tabulated are:

station number, name, elevation, location, (See page 62 for 40 acre tract and base & meridian description), cooperator number, cooperator's index number, period of record, and county. The cooperator numbers assigned are as follows:

000	Private Cooperator
403	Sonoma County Flood Control and Water Conservation District
407	San Benito County
411	Marin County
413	Marin Municipal Water District
414	Santa Clara Valley Water Conservation District
418	Vallejo Water Department
426	Santa Clara County Flood Control and Water District
801	Pomology Department, U. C. Davis
804	State Department of Beaches and Parks
806	State Department of Water Resources
808	State Division of Forestry
809	State Division of Highways
900	U. S. Weather Bureau
901	Corps of Engineers, San Francisco District
902	U. S. Air Force
907	State Climatologist (unpublished USWB)
909	U. S. Soil Conservation Service

The code for counties listed in this index is as follows:

Alameda	60	San Francisco	80
Contra Costa	07	San Luis Obispo	40
Marin	21	San Mateo	41
Mendocino	23	Santa Clara	43
Monterey	27	Santa Cruz	44
Napa	28	Solano	48
San Benito	35	Sonoma	49

Precipitation Data

Table A-2 presents total monthly and seasonal precipitation in inches for the period from July 1, 1964, through September 30, 1965.

Temperature Data

Table A-3 for the period July 1, 1964, through September 30, 1965, includes the maximum and minimum temperatures, the average of the daily maximum temperatures, the average of the daily minimum temperatures, and the average of the daily maximum and minimum temperatures recorded during the month. The temperatures are recorded in degrees Fahrenheit.

Evaporation Data

Table A-4 presents total evaporation during each month in inches, total wind movement during the month in miles, the monthly average of daily maximum water temperatures, and the monthly average of daily minimum water temperatures for the period July 1, 1964, through September 30, 1965.

Appendix B

SURFACE WATER FLOW

INTRODUCTION

This appendix presents surface water measurement data collected and assembled by the Department of Water Resources. It contains information collected in the Central Coastal Area during the 1965 water year covering the period from October 1, 1964, through September 30, 1965.

Definition of Terms

The following terms are commonly used:

Cubic foot per second, or second-foot, is the unit rate of discharge of water. One cubic foot per second is a cubic foot of water passing a given point in one second.

Gage Height or Stage is the elevation of the water surface above an assigned datum as measured by a gage. It is measured in feet to the nearest 0.01 foot.

Acre-foot is the quantity of water required to cover one acre to a depth of one foot. It is equivalent to 43,560 cubic feet or 325,850 gallons.

Water year is the 12-month period from October 1 of one year through September 30 of the subsequent year and is normally designated by the calendar year in which it is terminated.

Methods and Procedures

Streamflow Measurements

A stream gaging station is equipped with a continuous water stage recorder for which a stage-discharge relationship or rating is developed. The rating gives the flow or discharge in cubic feet per second (c.f.s.) for each water stage or gage height at a station. Given the rating and continuous water stage record, mean daily discharges are determined by electronic data processing methods.

The rating is developed by making streamflow measurements with a current meter at various water stages ranging from near minimum to near maximum. Normally, the rating is fairly permanent where there is a fixed channel and a fixed flow regimen at the station. The rating varies, however, where the bed of the channel is of loose shifting sand and gravel or where vegetative growth builds up in the channel changing the flow regime. Where the rating is not permanent and varies periodically, more frequent measurements of discharge are necessary to accurately determine the discharge, and manual computation may be required. Measurement procedures which have been employed are consistent with those used by the U. S. Geological Survey.

Tidal Stage Measurements

Along the Pacific Coast, there are usually two high and two low tides in a day. The lunar or tidal day is about 50 minutes longer than the solar day because tides are more strongly influenced by the moon than by the sun. The two high and two low tides which are usually unequal are commonly designated as higher high, lower high, higher low, and lower low waters. Tidal stage stations are equipped with continuous water level recorders.

Coding System

The station numbering system is that which is given in the Department publication entitled "Index of Stream Gaging Stations In and Adjacent to California, 1966". The stations for which data are given in this report are described either in the explanation of tables or in the tables.

EXPLANATION OF TABLES

Daily Mean Discharge

Table B-1 presents daily mean discharges in Butano Creek near Pescadero. The mean, maximum, and minimum values at the bottom of each

monthly column are representative of that month and year only. The acre-feet value for each month is a total of the daily values which are converted to acre-feet for the computation. The mean discharge under "Water Year Summary" is an average of the monthly means. The maximum and minimum discharges are instantaneous extremes that occurred during the year. The total acre-feet is the sum of the monthly acre-feet values. When flows at a single station are in excess of 140 percent of the highest measurement on the rating curve, the computed daily mean discharges from the electronic computer are shown as "estimates". Publication of the record of this station will be discontinued with this issue of Bulletin No. 130. Data for future years will be published in the "Surface Water Records" of the U. S. Geological Survey.

Imports

Table B-2 presents monthly deliveries of water into the Central Coastal Area. This table indicates the water user and the source of the supply. Monthly and water year total deliveries in acre-feet, average delivery in cubic feet per second, and monthly use in percent of annual are presented.

Daily Mean Gage Height

Table B-3 presents the daily mean gage height for Rector Reservoir near Yountville. These gage heights are from USC&GS mean sea level datum and are indicative of the amount of water in storage. The station is located on the outlet tower of the reservoir. Rector Reservoir is located about three miles northeast of Yountville on Rector Creek.

Daily Maximum and Minimum Tides

Table B-4 lists maximum and minimum tides at the Sacramento River at Collinsville and Suisun Bay at Benicia, respectively. These data are obtained from graphical charts plotted by continuous water stage recorders.

The values are in feet above -13.05 feet USC&GS mean sea level datum of 1929 at Collinsville and above -10.00 feet at Benicia. The values in most cases represent higher high water and lower low water. During a calendar day in which three instead of four tides occurred, the high and low values may represent lower high water or higher low water. The maximum and minimum values at the bottom of each monthly column represent the extremes observed during that month.

Station descriptions and historical data are provided at the bottom of Table B-4.

Corrections and Revisions to Previously Published Surface Water Data

Table B-5 lists corrections and revisions to previously published surface water data in order of publication date.

Appendix C

GROUND WATER MEASUREMENTS

INTRODUCTION

This appendix includes a figure, three tables, and one plate reporting on ground water conditions in the Central Coastal Area. The reporting period is from July 1, 1964, through September 30, 1965. In future bulletins the reporting period will be the water year.

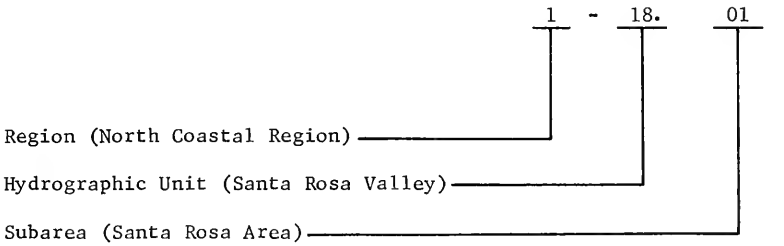
Methods and Procedures

The depth to water in most wells is usually a direct measurement made with a tape; however, in some wells, especially deep ones, measurements are made with an air line and gauge or an electric sounder. Field work was performed by local cooperators, the U. S. Geological Survey and Department personnel. An electronic computer program has been developed to perform a part of the processing and tabulating.

Coding

Region and Basin Numbers

The water pollution control board regions used in this report and shown on Plate 3, "Ground Water Basins or Units in the Central Coastal Area", are geographic areas defined in Section 13040 of the Water Code. Regions, ground water basins or units and subareas are listed by a numbering system as follows:



State Well Number

The state well numbering system used in this report is based on the township, range, and section subdivision of the Public Land Survey.

It is the system used in all ground water investigations made by the Department of Water Resources. In this report, the number of a well, assigned in accordance with this system, is referred to as the State Well Number. Under the system, each section is divided into 40-acre tracts lettered as follows:

D	C	B	A
E	F	G	H
M	L	K	J
N	P	Q	R

Wells are numbered within each 40-acre tract according to the chronological sequence in which they have been assigned State Well Numbers. For example, a well which has the number 16N/12W-17K1,M would be in Township 16 North, Range 12 West, Section 17, Mount Diablo Base and Meridian, and would be further designated as the first well assigned a State Well Number in Tract K.

EXPLANATION OF FIGURES AND TABLES

Hydrographs

Figure C-1, "Fluctuations of Water Levels in Wells", presents hydrographs of 21 selected wells in 19 selected basins or areas. These wells were selected insofar as possible as representative of their respective basins or areas.

Ground Water Level Changes

Table C-1, "Ground Water Level Conditions in the Central Coastal Area, Spring 1965", presents average depths to ground waters and average changes by basin and region from the spring of 1964 to the spring of 1965.

Description of Selected Wells

Table C-2, "Description of Selected Wells", is arranged in region, basin, and well number order, and provides a description of 368 wells for which ground water level data are presented in Table C-3, "Ground Water Levels at Wells".

Agency Well Number

The agency well number is the number assigned to a well by any agency other than the Department of Water Resources in accordance with the numbering system used by that agency. Agencies that use the State well numbering system normally coordinate assignment of well numbers with the Department. These numbers, when common, are not shown in the "Agency Well Number" column; when different, the last five digits are shown in the "Agency Well Number" column.

Agency Supplying Data

Each number in this column is the code number for a cooperating agency. The agency code consists of a five-digit number, the first of which is a region number. Thus, 32100 refers to Agency 2100 in Region 3. Because of the limitations of punch card space, the agency code has been shown as a four-digit number without the region number. Therefore, the four-digit agency code should always be referred to the region in which the well is located.

The first digit of the four-digit agency code, as listed below, designates the type of well numbering system used by the agency.

Code	Well Numbering System
1	Location numbers
2	Monterey County Flood Control and Water Conservation District or Santa Clara Valley Water Conservation District
3	Serial numbers
4	Local numbers
5	State or U. S. Geological Survey
6	U. S. Bureau of Reclamation
7	South San Joaquin Irrigation District

The last three digits of the agency code, as listed below, are numbers that designate, within specified serial limits, the type of agency from which the data were obtained.

Code	Type of Agency
000-049	Federal
050-099	State
100-199	County
200-399	Municipal
400-699	District - Water, Irrigation, Conservation, etc.
700-999	Private

The agencies and code numbers assigned to them in each of the regions are listed in the following tabulation:

Agency Code	Agency
	North Coastal Region (No. 1)
5000	U. S. Geological Survey
5050	Department of Water Resources
	San Francisco Bay Region (No. 2)
2400	Santa Clara Valley Water Conservation District
5000	U. S. Geological Survey
5050	Department of Water Resources
5100	Alameda County Flood Control and Water Conservation District
5101	Napa County
5109	Solano County
5401	Alameda County Water District
	Central Coastal Region (No. 3)
2100	Monterey County Flood Control and Water Conservation District
2400	Santa Clara Valley Water Conservation District
5050	Department of Water Resources
5005	Post Engineer Fort Ord
5101	San Benito County
5102	Santa Cruz County
5117	San Luis Obispo County Flood Control and Water Conservation District
5200	Gilroy, City of
5400	South Santa Clara Valley Water Conservation District

Well Use

The well use is indicated as follows:

Code	Well Use
1	Domestic
2	Irrigation
3	Municipal
4	Industrial
5	Injection or Recharge
6	Drainage
7	Domestic and Irrigation
8	Test, Monitor, Measurement
9	Stock
0	Unused

Well Depth in Feet

Well depths shown were reported by the owner, obtained from a driller's log, or measured at the time of the well canvass.

Data Available

Under this heading, code numbers, as listed below, indicate the type of data that are available with respect to well logs, water analyses, and production records.

Data	Code
Log record	
Log	1
Confidential log (Sec. 7076, Water Code)	2
Water Analyses	
Mineral	1
Sanitary	2
Heavy Metals	3
Mineral and Sanitary	4
Production Record	
Available	1
Pump Test Available	2

Record Begins and Record Ends

The last two digits of the year the record began or ended are shown.

Ground Water Levels at Wells

Table C-3, "Ground Water Levels at Wells", is arranged in region, basin, well number and date order. It includes measurements of depths to water in wells made from July 1, 1964, through September 30, 1965. Table headings discussed below are only those that were not discussed under "Description of Selected Wells".

Ground Surface Elevation in Feet

The numbers in this column give the elevation in feet of the ground surface from which depth to the water surface in the well is reported. The datum used is mean sea level, USC&GS datum, 1929. Elevations of ground surface are usually taken from topographic maps and the accuracy is controlled by topographic standards.

Date

The date shown in the column is the date on which the depth measurement, shown in the next column, was made. If the date of the month is unknown, it is indicated by 00.

Ground Surface to Water Surface in Feet

This is the measured depth in feet from the ground surface to the water surface in the well. Certain of the depth measurements in the column may be followed with an asterisk superscript to indicate a questionable measurement. Depth to ground water measurements may be questionable for such reasons as (a) well being pumped while undergoing measurement, (b) nearby pump operating, (c) casing leaking or wet, (d) well pumped recently, (e) air gauge measurement, or (f) recharge operations at well or nearby. The specific reason for any asterisk or any given measurement may be obtained from the Department of Water Resources.

Other symbols used are:

Measurement discontinued	+
Well destroyed	≠
No measurement for other reasons	$

Water Surface Elevation in Feet

This is the elevation in feet of the water surface in the well based on mean sea level, USC&GS datum, 1929. It was derived by subtraction of the depth measurement from the ground surface elevation. Negative values indicate elevations below datum.

The words FLOW and DRY are shown in this column to indicate a flowing or dry well respectively.

Agency Supplying Data

Each number in this column is the code number for the agency from which the water level data were obtained.

INTRODUCTION

Data presented in this appendix are measured values of selected quality characteristics of surface water samples collected in the Central Coastal Area during the period from October 1, 1964, through September 30, 1965.

Methods and Procedures

Laboratory alalyses were performed by the Department of Water Resources and the U. S. Geological Survey in accordance with "Standard Methods for the Examination of Water and Waste Water", 11th Edition, or with U. S. Geological Survey Water Supply Paper 1454, "Methods for Collection and Analyses of Water Samples". The methods yield comparable accuracy.

Tabulated values for dissolved minerals are the analytical quantity reported in parts per million (ppm) and a computed value for equivalents per million (epm). Total dissolved solids reported were determined by gravimetric determination at $180^{o}C$. Values for temperature are those measured in the field at the time of sampling. Trace element (heavy metal) concentrations were determined both by "wet" analyses and by the spectrographic method. Turbidities determined in the field are reported in Jackson candle units and those determined in the laboratory in parts per million silica. Color is reported in color units.

Coding

The station number is an arbitrary number that has been assigned to each station. The locations of the stations are shown on Plate 3.

EXPLANATION OF FIGURES AND TABLES

Definitions of abbreviations used in this appendix and not defined on the tables are as follows:

ABS	Alkyl benzene sulphonate
Al	Aluminum
As	Arsenic
BHC	Benzene hexachloride
BOD	Biochemical oxygen demand in parts per million
C	Celsius (centigrade)
cfs	Cubic feet per second
Cu	Copper
DWR	Department of Water Resources
F	Fahrenheit
Fe	Iron
Fld	Field
Lab	Laboratory
Mn	Manganese
MPN/ml	Most probable number per milliliter
N.C.	Non-carbonate
Pb	Lead
pH	The negative logarithm of the effective hydrogen ion concentration
PO_4	Phosphates
ppDDD	Para-para dichlorodiphenyldichloroethane
ppDDE	Para-para dichlorophenyldichloroethene
ppDDT	Para-para dichlorodiphenyltrichloroethane
ppm	Parts per million
PST	Pacific Standard Time
Susp.	Suspended
USGS	U. S. Geological Survey
Zn	Zinc

Specific Conductance

Data from two electrical conductivity recorders are presented in Figures D-1 and D-2. These data are machine prepared graphs. Daily mean values are plotted in Figure D-1 and single daily readings at 1300 hours are plotted in Figure D-2. Each figure or graph presents the data from a station.

Sampling Station Data and Index

Table D-1, "Sampling Station Data and Index", is an alphabetic listing of stations from which surface water samples were collected. The analyses of these samples are reported in subsequent tables. The station number is an arbitrary number that has been assigned to each station. The location pertains to either the township, range, and section of the Public Land Survey or to latitude and longitude. The stations are classified into basic data, investigational, and operational types.

Analyses of Surface Water

Table D-2, "Analyses of Surface Water", includes physical characteristics of the water and results of mineral and bacterial analyses. The data are presented by region and by stream from north to south within a region. At the time the samples were collected for laboratory examination, field determinations were made for dissolved oxygen (DO) by the modified Winkler method, water temperature, and pH. Visual inspections were made of the streams and the physical conditions were noted. This information is kept on file with the Department.

Samples collected for bacterial examination were analyzed by the laboratory as quickly as possible. Results of bacterial determinations presented in this appendix should be considered as qualitative and quantitative indicators. Undue weight should not be given to the values for quantitative purposes.

Data from operational stations are shown separately at the end of the table. These data consist of analyses of South Bay Aqueduct water.

Summary of Coliform Analyses

Coliform data included in Table D-2 are made more usable by summarizing the results of the analyses of the 24 samples collected at each station during the year. Table D-3 is a summary of these analyses.

Analyses of Trace Elements in Surface Water

Spectrographic analyses were made to determine the concentration of 17 different elements in surface water samples. Most of these elements are present in very small amounts and are often called trace metals. The concentrations indicated in Table D-4 are in parts per billion instead of parts per million which is commonly used in reference to concentrations of mineral constituents. The symbols included with the constituent quantities are:

> Greater than the amount indicated

< Less than the amount indicated

$\leqq$ Equal to or slightly less than the amount indicated.

Radioassays of Surface Water

Table D-5, "Radioassays of Surface Water", presents the radioactivity of surface water samples collected at 23 monitoring stations. The samples were collected in May and September at the same time that samples were collected for standard mineral analyses shown on Table D-2. The methods and procedures of sample preparation and determination of radioactivity in water are described in "Standard Methods for the Examination of Water and Waste Water", 11th Edition. The samples were analyzed by the Department of Public Health. Results are expressed in micro-micro curies per liter or by the equivalent units of pico curies per liter (PC/l). These units are defined as 10^{-12} curies. The most probable error is reported along with the measured value. Results should be considered qualitative and undue emphasis should not be given to quantitative values.

Four values are reported for each sample: (a) alpha activity in the filtrate (dissolved material), (b) alpha activity in the solids retained on the filter (suspended material), (c) beta activity in the filtrate, and (d) beta activity in the solids. Sample counts are corrected for background and geometric efficiency. Standard statistical procedures are utilized to compute the 0.9 error. The final result is expressed (symbolically) as $x \pm y$. This means that in a series of determinations on the same sample, the value of x should fall between $x - y$ and $x + y$ ninety percent of the time.

Salinity Observations at Bay and Delta Stations

Table D-6 describes the six stations for which salinity data are listed in Table D-7. Table D-6 includes maximum observed salinity at Bay and Delta stations. Table D-7 presents chloride concentrations in samples collected at six stations between Crockett and Collinsville.

Nutrients

Table D-8 presents analyses of nutrients in surface water. These analyses were made by the Department. The samples were kept on ice and were analyzed for the nitrogen series in the laboratory on the same day collected.

Pesticides

Table D-9 presents analyses of pesticides in surface water and sediment. The samples were analyzed by the Department using a gas chromatograph with an electron capture detector.

TABLE D-6

DESCRIPTION OF SALINITY OBSERVATION STATION

1964-65 Water Year

STATION	Miles from Golden Gate (a)	Time Interval (b) Hours	Min	LOCATION
Crockett - San Pablo Bay	27.7	3	30	West end of Carquinez Strait, south shore, 0.2 mile east of Carquinez Bridge on wharf of C and H Sugar Refinery Corporation.
Martinez - Carquinez Strait	33.1	3	50	Sampled from Shell Oil Company dock, about 0.6 mile downstream from Southern Pacific Company railroad bridge.
Port Chicago - Suisun Bay	41.0	4	20	South shore of Suisun Bay at U. S. Naval ammunition loading wharf below Port Chicago.
Middle Point - Suisun Bay	41.5	4	30	South shore of Suisun Bay at Allied Chemical Plant intake, about 0.5 mile upstream from Middle Point.
Pittsburg - Suisun Bay	48.0	5	00	East end of Suisun Bay, south shore, at Pittsburg Yacht Harbor.
Collinsville - Sacramento River	50.8	5	25	Sacramento River, north bank at junction with San Joaquin River.

MAXIMUM OBSERVED SALINITY AT BAY AND DELTA STATIONS

In parts of chloride per million parts of water*

STATION	WATER YEAR

* Ocean water contains approximately 18,200 parts per million of chloride.

a Mileage measured to station along main channel. For stations off the main channel, the mileage shown is the same distance along the main channel to a point whereon the time of the occurrence of the tidal phase is the same as that of the observation station.
b Time interval between high tide at Golden Gate and time for taking samples at station.
c Releases of stored water from Shasta Lake commenced in 1944.
d Releases of stored water from Folsom Reservoir commenced in 1956.
e Average taken as mean annual unimpaired flow at foothill stations of major tributaries for 50-year period October 1910 through September 1960.

Appendix E

GROUND WATER QUALITY

INTRODUCTION

Data presented in this appendix are measured values of selected quality characteristics of ground water samples collected in the Central Coastal Area during the period from July 1, 1964, through September 30, 1965. In subsequent reports, the period used will be the water year.

Plates 4 and 5 present the status of sea-water intrusion into the upper aquifer of the East Bay area of the Santa Clara Valley and two aquifers of the Salinas Valley, respectively. The lines depicting chloride concentrations in 1962, previously published in Bulletins 130-63 and 130-64, were adjusted for this report. The adjustments were made on the basis of additional controls available in 1965, and were made in order to more accurately depict the relative movement of chloride concentrations.

Methods and Procedures

Laboratory analyses were performed by the Department of Water Resources and the U. S. Geological Survey, all in accordance with "Standard Methods for the Examination of Water and Waste Water", 11th Edition, or with the U. S. Geological Survey Water Supply Paper 1454, "Methods for Collection and Analyses of Water Samples". The methods yield comparable accuracy.

Tabulated values for dissolved minerals are the analytical quantity reported in parts per million (ppm) and a computed value for equivalents per million (epm). Total dissolved solids reported were determined by gravimetric determination at 180°C. Values for temperature are those measured in the field at the time of sampling. Heavy metal concentrations were determined by "wet" analyses.

Coding

Wells and ground water basins are numbered in accordance with the system described in Appendix C. The data are presented in water pollution control board region, ground water basin and well number order.

EXPLANATION OF TABLES

Definitions of abbreviations used in this appendix and not given on the tables are as follows:

ABS	----	Alkyl benzene sulfonate
Al	----	Aluminum
As	----	Arsenic
C	----	Celsius (Centigrade)
Cr^{+6}	----	Hexavalent chromium
Cu	----	Copper
diss	----	dissolved
dom	----	domestic
DPH	----	Department of Public Health
DWR	----	Department of Water Resources
F	----	Fahrenheit
Fe	----	Iron
ind	----	industrial
irr	----	irrigation
Mn	----	Manganese
N.C.	----	Non-Carbonate
pH	----	The negative logarithm of the effective hydrogen ion concentration
ppm	----	parts per million
Se	----	Selenium
Temp	----	Temperature
USGS	----	U. S. Geological Survey
Zn	----	Zinc

Analyses of Ground Water

Table E-1 presents analyses of ground water in the same order as that for ground water level data in Appendix C.

Radioassays of Ground Water

Table E-2 presents the radioactivity of ground water samples collected from two wells in the Santa Clara Valley. The methods and procedures were the same as discussed under "Radioassays of Surface Water" in Appendix D.
